October 1990

BOBCAT SURVEY - 1989-90

by

Thomas M. Cooley, Stephen M. Schmitt, and Paul D. Friedrich

Introduction

In order to allow export of bobcat (Felis rufus) pelts under the Convention on International Trade in Endangered Species (CITES) the Fish and Wildlife Service compiles data on the harvest and status of bobcats. This documentation is necessary to verify the stability of populations and to allow continued harvest and exportation of pelts. This is the tenth consecutive year of the bobcat survey in Michigan (Cooley et al. 1981, 1982, 1983, 1984, 1985, 1986, 1987, 1988, 1989).

During the winter of 1989-90, the Wildlife Division requested that trappers and hunters submit bobcat skulls to the Department of Natural Resources for examination. This allowed Division personnel to age and sex the harvested bobcats by canine tooth examination. This information is summarized for bobcats harvested in the 2 northern Regions (Appendices I and II) and bobcats harvested from unspecified areas (Appendix III).

Materials and Methods

The lower jaw was removed from each skull and a lower canine was extracted for examination. Measuring the maximum root width and thickness of the canine allowed for sex determination (Friedrich et al. 1983) and age was estimated by cementum layer counts (Crowe 1975).

Results and Discussion

Region I

The number of samples collected this year was down markedly from last year (35 in 1989-90, 142 in 1988-89) and the total harvest was down 35.4%. The sex ratio of bobcats examined from Region I (Table 1) was 250:100 (25:10) males to females. This was the eighth time in 10 years of data collection that the ratio favored males (Cooley et al. 1981, 1982, 1983, 1986, 1987, 1988, 1989) and also agrees with the data of Erickson (1955) and Hoppe (1980). The percentage of

young-of-the-year (22.9) was down from last year (36.6%) and well below the average (39%) of all the years bobcats have been examined. The age classes 0-3 years made up 80% of the total animals submitted however, being consistent with previous data. The 1-2 year old and 2-3 year old age classes occurred most frequently in the sample.

Region II

The number of samples collected from Region II this year was markedly down from last year (42 in 1989-90, 158 in 1988-89) and from past years. The total harvest was down 54.9%. The sex ratio of Region II bobcats (Table 2) was 200:100 (28:14) males to females. This ratio was higher than last year's data and was the highest ratio since 1982 (285:100). The data was consistent with past year's data, in that, males were predominant in the samples collected. The percentage of young-of-the-year (21.4%) was down slightly from last year's data (25.3%) and was the lowest since 1985 (17.4%). The percentage was below the average (27%) of all of the years bobcats have been examined. The age classes 0-3 years made up 64.3% of the total animals submitted, down from last year's figures (72.2%) and the lowest total since 1985 (39.1%). The yearling, young of-the-year, and 3-4 year age classes occurred most frequently in the sample.

Regions I and II

Changes in regulations for the 1989-90 season were reflected in the reduced harvest and the smaller number of carcasses made available for examination. The bag limit was reduced to 1 bobcat and it was not mandatory to give the animal's head to the DNR for examination. The bobcat harvest was reduced markedly from 500 (Region I = 229, Region II = 268 animals harvested) in 1988-89 to 269 (Region I = 148, Region II = 121 animals harvested) in 1989-90. The number of skulls submitted dropped from 304 in 1988-89 to 79 in 1989-90. The combined totals of the submitted skulls from both regions (Table 4) exhibited a distribution in the age classes and sex ratios consistent with past years' data.

Sex ratios calculated by tooth measurement in previous years have not differed significantly from the actual sex ratios of the samples (Friedrich et al. 1983 and Unpublished Data). However, the differences suggest that the calculated values could be adjusted by +4.4% for juvenile males, -4.5% for juvenile females, -1.5% for adult males, and +1.7% for adult females.

Management Application

The collection and examination of bobcat teeth provided additional baseline information. Using dental measurements for sex determination has allowed for easier data collection. These data, in conjunction with future information will allow the Wildlife Division to develop a population model and help assure Michigan trappers and hunters the opportunity to harvest and export this furbearing species in the future.

Acknowledgements

We thank the bobcat trappers and hunters for their cooperation and the biologists and technicians for gathering the bobcat heads and submitting them for examination. Thanks is also extended to Myra Fraidenburg for assisting in the preparation of this report.
