BOBCAT SURVEY - 1996-1997 [1]

by

Thomas M. Cooley, Stephen M. Schmitt, Paul D. Friedrich and Tim F. Reis

Introduction

In order to allow the export of bobcat (*Felis rufus*) pelts under the Convention on International Trade in Endangered Species (CITES), the United States Fish and Wildlife Service compiles data on the harvest and status of bobcats. This documentation is necessary to verify the stability of bobcat populations to allow for their continued harvest and exportation of pelts. This is the seventeenth consecutive year of the bobcat survey in Michigan (Cooley et al. 1981, 1982, 1983, 1984, 1985, 1986, 1987, 1988, 1989, 1990, 1991, 1992, 1993, 1994, 1995, 1997).

During the 1996-97 bobcat hunting and trapping season, licensed furtakers were allowed 3 bobcats per person. However, no more than one bobcat could be taken in management Zone 2. As in previous years, the Wildlife Division of the Department of Natural Resources required trappers and hunters to submit bobcat skulls or teeth for examination, and the pelt for sealing. The age and sex of harvested bobcats were determined by canine tooth examination. Survey results are summarized by management zone (Zone 1 - Upper Peninsula, Zone 2 - Northern Lower Peninsula) in tables 1-3.

Materials & Methods

A lower canine tooth was extracted after the skull was boiled in water for 1 hour. Maximum root width and thickness of the canine allowed for sex determination (Friedrich et al. 1983). Age was estimated by counting cementum annuli in longitudinal thin sections of the tooth root (Crowe 1975).

Results and Discussion

Zone I

The number of samples submitted (511) and the registered harvest (673) was more than double last year's figures, 183 and 280 animals, respectively. The sex ratio of bobcats examined from Zone I (Table 1) was 93:100 (actual 246:265) males to females. This was the fourth time in seventeen years of data collection that the ratio favored females (Cooley et al. 1984, 1985, and 1992). The percentage of young-of-the-year (25.4%) was more than last year (19.7%), but well below the average (33.1%) of the previous 16 years. Of the bobcats submitted, 70.5% were less than 3 years of age, which is consistent with previous years' data. The 1-2 years old (29.9%) and the 0-1 year old (25.4%) age classes occurred most frequently in the sample.

Zone II

The number of samples collected (180) and the registered harvest (207) from Zone II were up from last year, 139 and 152 animals, respectively. The sex ratio of Zone II bobcats (Table 2) was 100:100 (actual 90:90) males to females. The percentage of young-of-the-year (14.4%) was down from last year (18.0%) and down considerably from the 16-year average (24.7%). Of the bobcats submitted, 68.3% were less than 3 years of age, which is consistent with previous years' data. The yearling (1-2 years) age class occurred most frequently (32.2%) in the sample.

Zones I and II

The number of bobcats registered during the 1996-97 season (880) was markedly more than last year (432), but similar to the 1994-95 figure (795). The mandatory submission of bobcat heads or teeth to the DNR for examination resulted in 691 useable samples (up from last year's 322 samples) for a compliance rate of 78.5% (691/880). The combined totals of the submitted samples from both zones (Table 3) exhibited a distribution in the age classes and sex ratios consistent with past years' data.

Management Implications

The collection and examination of bobcat teeth provides baseline information on the status of bobcat populations in Michigan. Using dental measurements for sex determination has allowed for easier data collection. These data, in conjunction with the results from current bobcat research in Michigan will allow the Wildlife Division to develop a population model and to help assure Michigan trappers and hunters continue to have the opportunity to harvest and export this furbearing species in the future.

Acknowledgments

We thank the bobcat trappers and hunters for their cooperation and Wildlife Division personnel for collecting the bobcat heads and teeth and submitting them for examination. Thanks is also extended to Jean Fierke for assisting in analysis and to Dona Redmond for assisting in the preparation of this report.
