

Gratiot-Saginaw State Game Area Planting Number 1  
Planted Spring 1942

Purpose of Planting

Much of the state-owned land in the Gratiot-Saginaw State Game Area is covered by a dense popple growth resulting from frequent burning. Cover is deficient, however, on the many low sand ridges which wind through the wetter popple areas. Fire has burned much of the humus from these ridges so that small bare or moss covered areas are frequent and only a sparse ground cover of grasses and widely scattered shrubs and trees prevails. The popple does not afford much winter cover, and wild-life food is not abundant.

To remedy these deficiencies, the ridges were planted with strips and clumps of pine. At the base of the ridges, where the soil was heavier and moister "food patch" plantings of fruit-bearing and nut-bearing trees and shrubs were put in. Near these were planted strips and clumps of spruces.

For a listing of legal descriptions, tract numbers, and acreage of areas planted see Table I. A list of the species planted, and numbers, age, and size of stock planted is given in Table II, and the number of each species planted in each section, in Table III. Planting costs are summarized in Table IV.

General Planting Information

Planting Stock:

The pines were produced at the Higgins Lake Nursery, and the spruces and deciduous trees and shrubs, at the Hardwood Nursery, with the following exceptions: Common alderberry and wild grape from the Michigan State College Nursery, and black walnut from the Soil Conservation Service Nursery (Dayton, Ohio). The stock was delivered in Game Division trucks driven by the Game Area Manager. Stock was picked up from the Higgins Lake Nursery on April 27, 1942, and from the Hardwood Nursery on May 5, 1942. It was delivered on the day picked up and was heeled in the following day. The stock was in good condition when received and when planted, except for some of the spruces, which may have been held heeled in too long, and the walnuts, which may have suffered from being held heeled in successively at Allegan, the Barry County State Game Area, and finally the Gratiot-Saginaw State Game Area. The walnuts were delivered on May 6, 1942, and the wild grape and common elderberry on May 13, 1942.

Source of Labor and Rate of Pay:

Laborers consisted of local farmers and shop workers temporarily laid off while the factories were tooling up for war work. The foreman is the local Key Man (fire fighting) for our Field Administration Division. The crew was paid \$0.60 per hour and the foreman \$0.69 per hour.

Soil Preparation:

No soil preparation was found necessary. The only exception to this was found in NW $\frac{1}{4}$  Section 22, where heavy sod made scalping necessary. However, this amounted to only 1.8 acres of the 244.1 acres planted.

Method of Planting:

Nearly all planting was done with shovels used as dibbles. Dibbles were tried, but the crew preferred the shovels. The shovels used were the property of the Field Administration Division and were obtained from the Key Man, my foreman. The black walnuts (425) and spruces (10,280) were planted by digging holes with shovels.

Spacing and Rate per Acre:

Plants were spaced 10 feet apart, at a rate of 436 per acre. This spacing, somewhat greater than normal, was deliberately selected as an experiment.

Dates of Planting:

Planting commenced on April 29, 1942 and ended on May 27, 1942.

Soil Types:

Planting was done on principally Arenac Fine Sand, and to a lesser degree Newton loamy sand.

Weather and Moisture:

An exceptionally dry April left soil conditions really too dry for best planting. Bare sand areas were frequently so dry that the sand persisted in trickling back into the hole before the plant could be inserted. However, light rains fell during the latter part of the planting period and the month following was exceptionally rainy.

Quality of Planting:

The planting was well done and high survival is expected. Early survival was practically 100 per cent. In the first plantings "food-bearing" plants were planted in greater numbers than had been planned. Additional planting of these species in Sections 11, 14, 21, 27, and 28 is recommended.

Check Plots:

No check plots were laid out. In the future, a limited number of clumps and short strips on different types of soil and in differing situations topographically will be selected and marked.
